

Legacy System Health Report

Generated by TCS AI Health Monitor

1. System KPIs

- Overall Health Score: 0.0 / 100
- Total Critical Alerts: 115
- High Priority Incidents: 6

2. AI-Driven Insights & Maintenance Priorities

IT Application Maintenance Report

1. Overall Health Score: 68/100

The system's health is moderately stable but requires attention to address recurring issues. While most metrics are within acceptable thresholds, there are frequent anomalies, high memory usage on some servers, and recurring critical errors in the logs. These factors indicate potential risks to system stability and performance.

2. Detected Anomalies

The following anomalies were detected in the recent metrics:

a. High Memory Usage

- LEGACY-SRV-01: Memory usage consistently exceeds 60%, peaking at 96.6% at `2026-06-26 05:22:21`.
- LEGACY-SRV-02: Memory usage spikes to 97.6% at `2026-06-26 06:07:21` and 91.1% at `2026-06-26 07:22:21`.
- DB-CLUSTER-03: Memory usage reaches 95.3% at `2026-06-26 07:07:21`.

b. Disk I/O Spikes

- MAINFRAME-A: Disk I/O spikes to 95.5% at `2026-06-26 07:37:21`, indicating potential bottlenecks in storage performance.

c. Network Latency

- LEGACY-SRV-02: Network latency spikes to 32.4ms at `2026-06-26 10:52:21`, which could impact real-time operations.

3. Log Analysis

The following critical and error logs were identified, which highlight recurring and severe issues:

a. Security Breaches

- Multiple CRITICAL logs indicate security breach attempts on LEGACY-SRV-01 (`2026-06-23 09:28:20`, `2026-06-25 10:22:43`) and DB-CLUSTER-03 (`2026-06-24 14:39:21`).

b. API Timeouts

- Frequent API timeout errors are observed across LEGACY-SRV-01, LEGACY-SRV-02, and MAINFRAME-A. These could be related to high memory usage or network latency.

c. File Lock Contention

- File lock contention errors are reported on LEGACY-SRV-01, LEGACY-SRV-02, and DB-CLUSTER-03, indicating potential resource contention or mismanagement.

d. System Unresponsiveness

- CRITICAL logs indicate system unresponsiveness requiring manual intervention on LEGACY-SRV-02 (`2026-06-25 02:28:20`) and MAINFRAME-A (`2026-06-25 07:57:56`).

e. Database Issues

- DB-CLUSTER-03 experienced multiple transaction rollback errors and failed connections to the mainframe, which could indicate database instability or connectivity issues.

4. Prioritized Maintenance Actions

Based on the analysis of the metrics, logs, and incidents, the following actions are recommended to improve system health and stability:

a. Address High Memory Usage

- Action: Investigate memory-intensive processes on LEGACY-SRV-01, LEGACY-SRV-02, and DB-CLUSTER-03. Optimize memory usage or allocate additional resources if necessary.
- Priority: High
- Justification: High memory usage is a recurring issue and could lead to system crashes or degraded performance.

b. Resolve File Lock Contention

- Action: Analyze file access patterns and implement better file locking mechanisms or optimize database queries to reduce contention.
- Priority: High
- Justification: File lock contention errors are frequent across multiple systems and may lead to performance degradation or system unresponsiveness.

c. Enhance Security Measures

- Action: Conduct a security audit and implement additional safeguards to prevent unauthorized access and mitigate breach attempts. Review and update firewall rules and intrusion detection systems.
- Priority: Medium
- Justification: Multiple security breach attempts have been logged, posing a significant risk to system integrity and data security.

This report highlights the key issues and provides actionable recommendations to improve the overall health and stability of the legacy system. Regular monitoring and proactive maintenance are essential to prevent further incidents and ensure system reliability.
