

Legacy System Health Report

Generated by TCS AI Health Monitor

1. System KPIs

- Overall Health Score: 0.0 / 100
- Total Critical Alerts: 115
- High Priority Incidents: 6

2. AI-Driven Insights & Maintenance Priorities

Legacy System Health Report

1. Overall Health Score: 72/100

Justification:

- The system is operational but shows recurring issues:
 - Memory leaks (e.g., `LEGACY-SRV-01` at 96.6% memory usage, `DB-CLUSTER-03` at 95.3%).
 - Anomalies in disk I/O (e.g., `MAINFRAME-A` spiking to 95.5%).
 - Network latency spikes (e.g., `LEGACY-SRV-02` at 32.5ms).
- Frequent error logs (API timeouts, file locks, security breaches) and past incidents (database deadlocks, backup failures) indicate instability.

2. Detected Anomalies

Server	Metric	Value	Timestamp	Notes
-----	-----	-----	-----	-----
`LEGACY-SRV-01`	Memory Usage	96.6%	2026-06-26 05:22:21	Critical memory pressure
`LEGACY-SRV-02`	Memory Usage	97.6%	2026-06-26 06:07:21	Near OOM condition
`DB-CLUSTER-03`	Memory Usage	95.3%	2026-06-26 07:07:21	Critical memory pressure
`MAINFRAME-A`	Disk I/O	95.5%	2026-06-26 07:37:21	Abnormal disk activity
`LEGACY-SRV-02`	Network Latency	32.5ms	2026-06-26 10:52:21	Potential network bottleneck

3. Log Analysis

Critical/Error Log Summary

- Security Threats:
 - Multiple `CRITICAL` logs for security breach attempts (`LEGACY-SRV-01`, `DB-CLUSTER-03`).
- Connectivity Issues:
 - Repeated `Failed to connect to mainframe` errors (`DB-CLUSTER-03`, `LEGACY-SRV-01/02`).
- Performance Bottlenecks:
 - Frequent `API timeout after 30s` (`LEGACY-SRV-01/02`, `MAINFRAME-A`).
 - `File lock contention` across multiple servers (indicative of resource starvation).
- System Failures:
 - `Transaction rollback triggered` (especially on `MAINFRAME-A` and `DB-CLUSTER-03`).
 - `System unresponsive` incidents requiring manual intervention.

4. Prioritized Maintenance Actions

1. Investigate Memory Leaks

- Focus on `LEGACY-SRV-01`, `LEGACY-SRV-02`, and `DB-CLUSTER-03`.
- Profile applications/services consuming excessive memory; consider restarting affected processes.

2. Resolve Disk I/O Spikes on MAINFRAME-A

- Check for stuck processes or runaway batch jobs.
- Verify disk health and storage thresholds.

3. Address Recurring API Timeouts

- Review network configuration between legacy systems and mainframe.
- Optimize query performance in the legacy CRM database (linked to past deadlock incidents).

Additional Recommendations:

- Schedule emergency patching for security vulnerabilities (repeated breach attempts).
- Monitor file locks and implement retry mechanisms for contended resources.

Next Steps: Escalate to the infrastructure team for immediate memory/disk I/O triage. Schedule a post-mortem for recurring API timeouts.

Confidential - For Internal IT Maintenance Use Only
